

Considered But Rejected: *Diplacus tricolor*

Aaron E. Sims

November 14, 2016

Background

Proposed for review (as *Mimulus tricolor*) by US Forest Service on November 14, 2012, as plant they were considering adding to the FS sensitive species list. After reviewing Jepson eFlora and CCH, it is apparently too common for inclusion at this time. It doesn't seem like there have been any changes to the concept of this species since the time it was proposed, and is now treated as *Diplacus tricolor* by G. Nesom for FNA.

Diplacus tricolor currently has 409 records in CCH, occupying a wide distribution throughout the north coast, great valley, and north to Modoc. 126 non-duplicate records are indicated in the Jepson eFlora. Demonstrably too common for inclusion in the CNPS Inventory at this time.

Inventory Record

Diplacus tricolor

CBR: Too common.
