

*Juncus tiehmii* – Considered But Rejected on 13 April 2016.

Aaron E. Sims, CNPS Rare Plant Botanist

*Juncus tiehmii* was proposed for addition by Dean Taylor in March of 2009. At that time it had 112 Consortium of California Herbaria records. As of 13 April 2016 it has 170 specimen records, and thanks to the “Heath Bar” in the Jepson eFlora, it is easy to see that it has 104 non-duplicate records, mostly throughout the Mojave Desert and southwest region, but also scattered up the eastern Sierra Nevada to Modoc and the high Cascade Range. Demonstrably too common and widespread even for List 4 status.
