

***Petrophytum caespitosum* subsp. *caespitosum***

Considered But Rejected: Too common

Aaron E. Sims, September 13, 2018

Proposed for status from David Magney based on paucity of herbarium specimens. Jim Morefeild indicates it as being a challenging specimen collection target and probably under-collected. I have a number of photos of this taxon from the Panamint Mountains of Death Valley, where I remember it being prolific throughout limestone ledges. Also relatively common throughout White Mountains; I remember seeing it along most parts of the Methusela Trail. No immediate threats known (other than the obvious climate change).
